

Main threats:

Habitat separation

Roads and housing can separate good habitat so animals find it difficult to move around

Main threats:

Habitat loss

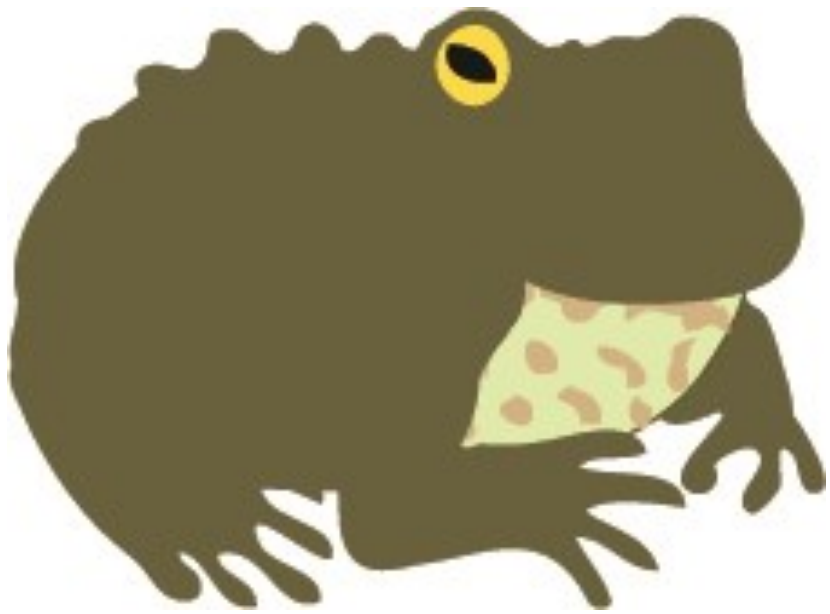

People want cheaper food and more houses, roads and supermarkets. This means ponds are being filled in and good habitat is lost.

Main threats:

Disease

A dangerous disease that affects frogs, toads and newts is spreading all over the world. Amphibians catch diseases easily because they have sensitive skin.

Main threats:

Climate change

Our climate is getting warmer and wetter. This means disease spreads faster and flooding moves hungry fish to new ponds
